SAFETY DATA SHEET Form with various fields for hazard information, handling, and storage.

Registration Form for the Priority Arsenal Child & Youth Services Program, including fields for sponsor and child information.

Large, complex form with multiple sections, including a header 'UNIFORM SERVICE (See 47b (2)(A) (5) (B))' and various numbered fields.

For them, the decision may be less about politics and principles and more about keeping the company productive, making money, and staying in business. When consulting an MSDS, keep in mind that few substances are pure forms of molecules, so the content of an MSDS will depend on the manufacturer. MSDSs have been around, in one form or another, since the time of the ancient Egyptians. In this case, you can scan the MSDS for any safety precautions, health effects, storage cautions, or disposal instructions. There are links to MSDS databases from this site. If productivity slows or stops altogether, you could incur greater losses in revenue than the cost of paying the ransom. Share your opinions with fellow TechRepublic members. With ransoms increasing and the technology becoming more sophisticated and more difficult to identify, this growth spurt shows no signs of slowing down any time soon. SEE: WannaCry: The smart person's guide Paying the ransom The upside to paying is immediate in most (but not all) cases. I feel, personally, that it isn't so black and white and that each scenario should be addressed based on the circumstances rather than choosing an answer based on a preset plan. Although MSDSs are targeted at workplaces and emergency personnel, any consumer can benefit from having important product information available. You will receive the decryption key, which will allow you to decrypt your data and recoup your files. Theoretically, MSDSs can be written by pretty much anyone (although there is some liability involved), so the information is only as accurate as the author's references and understanding of the data. But I have worked with companies that paid the ransom because it came down to their bottom line. A National Supply Number is a four-digit FSC class code number plus a nine-digit National Item Identification Number or NIIN. According to a 1997 study by OSHA, "one expert panel review established that only 11% of the MSDSs were found to be accurate in all of the following four areas: health effects, first aid, personal protective equipment, and exposure limits. An MSDS might appear to be intimidating and technical, but the information is not intended to be difficult to understand. It does not specify what chemicals are in the product or whether the product is a mixture of chemicals or a single chemical. Know their hazards and plan your response to an emergency before it happens! This doesn't mean that MSDSs are useless, but it does indicate that information needs to be used with caution and that MSDSs should be obtained from trustworthy and reliable sources. Certain MSDSs, such as those for drugs, may be more difficult to obtain, but are still available upon request. As Michael Kassner predicted back in

2010, "Ransom on the internet may not garner much money per incident but patient extortionists can cast a wide net and haul in hundreds of innocent victims who have no recourse other than to pay." His 2015 follow-up article based on the evidence available at the time, it was right. They say you should focus on backing up your data correctly so that it can be restored—and do not pay the ransom. Despite the rapid growth of this malware type and continued warnings from security professionals everywhere, ransomware has evolved into a billion dollar industry. The bottom line: Respect the chemicals you use. Ransomware has exploded like gangbusters. The recent outbreak of WannaCry (and its variants) is the latest in a long line of malware that is targeting all types of systems worldwide for maximum impact. You can usually search for substance using its CAS (Chemical Abstracts Service) registry number. Different chemicals may have the same name, but each will have its own CAS number. More often, MSDSs are read after a product is purchased. A generic name or chemical family name describes a group of chemicals with related physical and chemical properties. Paying the ransom may reduce the impact of the attack on your company’s liability or other fiduciary responsibility. An MSDS provides information about proper storage of a substance, first aid, spill response, safe disposal, toxicity, flammability, and additional useful material. And what a powder keg of a question that one is, with no clear-cut right or wrong answer to the dilemma, since each situation could potentially be different from the next. The instructions on an MSDS do not replace those of a health care professional, but can be helpful emergency situations. Also, some products intended for consumer use are sold with MSDSs enclosed. Not paying the ransom Most individuals who lean toward not paying the ransom cite one belief as their main reason: Paying up encourages ransomware, which allows it to grow and thrive. A Material Safety Data Sheet or is a summary of the key properties of a substance and the hazards associated with its use.Material Safety Data sheets are not standardized, so it's important to consult one provided by a respected source.Two chemicals that have the same name may have very different MSDS sheets because the particle size of the product and its purity may significantly affect its properties.MSDS sheets should be kept in an easy-to-find location and made accessible to all persons dealing with chemicals. However, if you are reading this article online then you have easy access to thousands of MSDSs via the internet. You might simply scan an MSDS to see if any warnings or hazards are delineated. MSDSs are not limited to reagents used for chemistry, but are provided for most substances, including common household products such as cleaners, gasoline, pesticides, certain foods, drugs, and office and school supplies. Sometimes the easiest way to locate a product is to search by manufacturer. I can sympathize with the “do not pay” crowd on the theory that paying encourages threat actors to continue to push the boundaries and expand their attacks further. And let’s not forget the tech pundits who repeat, as if they’re speaking a mantra, that proper backups are the only things that are necessary. A Material Safety Data Sheet (MSDS) is a written document that provides product users and emergency personnel with information and procedures needed for handling and working with chemicals. Also read... Your thoughts Have you been the victim of ransomware? An MSDS is an excellent resource to consult when a product has been spilled or a person has been exposed to the product (ingested, inhaled, spilled on skin). If the content is difficult to understand there are online MSDS glossaries to help define any unfamiliar words and often contact information for further explanations. Further, the health effects data on the MSDSs frequently are incomplete and the chronic data are often incorrect or less complete than the acute data". MSDSs often list symptoms that might indicate exposure to the product. The biggest question that rings out from individuals facing ransomware infections is this: Should I pay the ransom? What are your thoughts on paying vs not paying the ransom? And now, ransomware has far exceeded its meager \$24 million intake in 2015. Every enterprise is different, so the issue might be resolved in days, weeks, or never, in the case of complete loss. The chemical name or specific name is used most often to find MSDSs for health effects and protective measures. IUPAC (International Union of Pure and Applied Chemistry) conventions are used more often than common names. Synonyms are often listed on MSDSs. The molecular formula may be used to locate a chemical of known composition. Others feel that out of principle, ransom should not be paid because of the criminal nature behind trapping someone’s data. A trade name or product name is the brand, commercial, or marketing name the manufacturer gives the product. To locate an MSDS for a product you will need to know its name. Products may be found using their US Defense Department NSN. Although MSDS formats vary somewhat between countries and authors (an international MSDS format is documented in ANSI Standard Z400.1-1993), they generally outline the physical and chemical properties of the product, describe potential hazards associated with the substance (health, storage cautions, flammability, radioactivity, reactivity, etc.), prescribe emergency actions, and often include manufacturer identification, address, MSDS date, and emergency phone numbers. In other words, two MSDSs for the same chemical may contain different information, depending on the impurities of the substance or the method used in its preparation. College and university chemistry departments will maintain MSDSs on many chemicals. Alternate names for chemicals are often provided on the MSDS, but there is no standardized naming of substances. And in some situations, not paying could put lives at risk, as hospitals and governments have been increasingly targeted in recent attacks. Familiarity with MSDSs allows for precautions to be taken for potentially dangerous products; seemingly safe products may be found to contain unforeseen hazards. Playing devil’s advocate, let’s consider the pros and cons of of the pay/no-pay decision to better understand both sides of this growing issue. Finally, preserving public trust is another reason to pay the ransom and move forward, as a large enough loss of reputation can be the death knell for a company. Many companies have MSDSs for their products available online via their websites. Since the point of an MSDS is to make hazard information available to consumers and since copyrights don’t tend to apply to restrict distribution, MSDS are widely available. Sometimes an MSDS will list only the generic name of a product, although in most countries laws require that chemical names also be listed. SEE: 17 tips for protecting Windows computers and Macs from ransomware (free PDF) Who’s right? In many countries, employers are required to maintain MSDSs for their workers, so a good place to locate MSDSs is on the job. They believe that law enforcement and the security industry should have a better grasp on resolving this, since so many are being affected by this annually. Ideally you would read an MSDS before obtaining a product so that you could prepare proper storage and handling. It’s clear that both camps can cite a variety of reasons to support the decisions they make. Material Safety Data Sheets are not created equal.
